

6 Game

dominoes

Target zero

- 1 The person who is quickest to find the blank domino is the leader and **draws an empty number line back from 100.**

- 2 The other players turn the rest of the dominoes face down.
- 3 Each player takes 5 dominoes and lines them up so only they can see them.
- 4 The player who is the leader chooses one of their own dominoes and makes a 2-digit number.

For example

Jess decides to subtract the number 64 from 100.

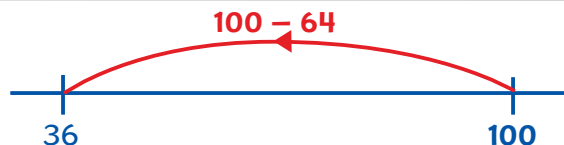

This domino could be 64.
It could also be 46.

$$100 - 60 = 40$$

$$40 - 4 = 36$$

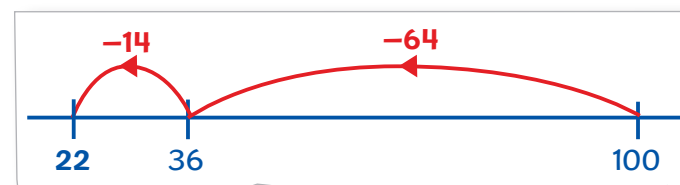

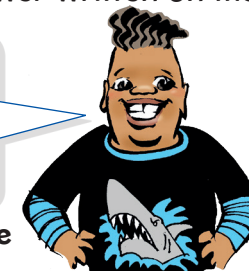

- 5 If the other players agree the answer is correct, the player draws a jump back down the number line and writes their answer.

- 6 The next player makes a number with one of their dominoes. They take this number away from the answer written on the number line.

I made 14.
 $36 - 10 = 26$
 $26 - 4 = 22$

Tane

- 7 Players keep jumping back down the number line until nobody can make a number that can be subtracted from the last answer, or someone lands on zero.
- 8 The player who jumped last is the winner and draws the number line for the next game.
