

We add and subtract integers quite a lot in real life, for example when temperatures rise and fall.

Where else are negative numbers used in real life?

I think we add and subtract decimals more often than integers. We add and subtract money all the time.

Think of three more examples where decimals are added and subtracted in real life.

C

I can't think of anywhere I have added and subtracted fractions in real life.

When else might we need to add and subtract fractions?

I have. What about fractions of pizza left over and you want to add them up to see how much you have got in total.
